

A PC-BASED INTERFEROMETER
FOR
RADIO ASTRONOMY

A Thesis
Submitted for the Degree of
Master of Science
in the Faculty of Engineering

By
JAYAPRAKASH, N.

Department of Electrical Communication Engineering
Indian Institute of Science .
Bangalore 560 012 -
November 1990

ACKNOWLEDGEMENTS

I am grateful to Professor B.S. Sonde and Professor V. *Radhakrishnan*, my supervisors, for their guidance, keen interest in the work, and for many *valuable* discussions throughout the course of this research work.

I am indebted to Professor Ch. *V. Sastry*, Indian *Institute* of Astrophysics, who initiated this exercise and to Dr A.A. Deshpande *and* Dr *N. Udayashankar*, *Raman* Research *Institute* for their numerous suggestions and encouragement throughout this work.

I thank Ms. *Nalini* Heerelall, University of Mauritius, for the help rendered in interpreting the initial observations.

Any project which involves building, testing and installation of a new instrument and, finally getting it to do what is intended, necessarily involves many people at different stages. I thank all my colleagues at the *Raman* Research Institute, who were involved in this project and the staff at the Gauribidanur field station, who were fully involved in the *installation* of this instrument there.

Throughout the course of this work I have received very good help from the library staff and computer center. I thank them all and particularly mention Johnson, *Ratnakar* and Hanumappa for their care and efficiency in making copies of this thesis.

Finally my thanks are due to my wife *Shashikala* and my son Bunty for their understanding while I was away at Gauribidanur for extended stretches during the installation and observations.

CONTENTS

CHAPTER – I INTRODUCTION

1.1 Interferometry	1
1.2 Interferometry in Radio Astronomy	1
1.3 Thesis Organisation	4

CHAPTER – II RADIO INTERFEROMETERS – A SURVEY

2.1 Radiotelescopes – Historical Review	6
2.2 Filled Aperture Radiotelescopes	9
2.3 Unfilled Aperture Radiotelescopes	13
2.3.1 Radio Interferometer	13
2.3.2 Dilute Aperture Telescope	16
2.3.3 Aperture Synthesis	19
2.4 A Typical Interferometer	20
2.5 A Typical Data Acquisition System	27
2.5.1 Multiplexer	27
2.5.2 Sample and Hold	28
2.5.3 Amplifier	32
2.5.4 ADC	32
2.5.5 Latch	35
2.5.6 Storage	35
2.5.7 Timing and Control	37
2.6 Computers in Radio Interferometers	38
2.7 PC-based Interferometer – A Need	42

CHAPTER _III ANALYSIS AND DESIGN

3.1 Specifications	44
3.1.1 Field and Receiver system	44
3.1.2 DAS	49
3.1.3 Data Analysis Computer	50
3.2 Analysis	52
3.2.1 Multiplexer	53
3.2.2 S/H Circuit	53
3.2.3 Programmable-Gain Amplifier	55
3.2.4 ADC	55
3.2.5 Storage	57
3.2.6 Software	59
3.3 Design	60
3.3.1 Input Signal Processing	62
3.3.2 A/D Conversion and Bus Interface	63
3.3.3 Timing and Control Logic	67
3.3.4 Software Module	70

CHAPTER _IV EXPERIMENTAL WORK AND RESULTS

4.1 Field Unit	79
4.1.1 Antennas	79
4.1.2 Primary RF power combiners	79
4.1.3 Highpass filters and LNA	83
4.1.4 Secondary RF power combiners and Amplifier	87
4.1.5 First Heterodyning Mixer	91
4.1.6 LO distribution network	94

4.2 Lab Unit	97
4.2.1 First IF Amplifiers.....	97
4.2.2 Second Heterodyning Mixer	97
4.2.3 Correlators and PSDs.....	103
4.3 PC-based DAS	105
4.3.1 MUX and PGA	107
4.3.2 ADC.....	109
4.3.3 Timing and Control Logic.....	109
4.3.4 Complete DAS	109
4.4 System Integration and Results	114
 CHAPTER _ V CONCLUSION	
5.1 Review	121
5.2 Scope for Future Work	122
5.2.1 On-line data analysis.....	122
5.2.2 General purpose DAS.....	123

APPENDIX _ A Sensitivity Calculations	131
APPENDIX _ B Pin-out Details	133
APPENDIX _ C Helical Antenna _ Empirical relations	135
APPENDIX _ D List of Abbreviations	136

CHAPTER - I

INTRODUCTION

1.1 Interferometry

Interferometry is now a well established experimental technique of considerable importance in science and technology. In these *nearly* ten decades of its existence, interferometry has advanced greatly, almost in step with the advances in electronics, optics and related fields. While the first *interferometer* was developed by Michelson in 1890 [1] to estimate stellar diameters, more recent developments in interferometry have taken its application areas into other branches of science, such as radio astronomy, spectroscopy, etc. To the astronomer, interferometry provides a means of measurement of stellar diameters; and more recently a powerful tool in high resolution radio astronomy, both implying studies of the angular distribution of radiation on the sky. For the spectroscopist, it facilitates measurement of *spectral* distributions and represents a new technique for high resolving power and increased sensitivity. To the optical designer, it is a method of testing lenses and, to the biologist, it is a new branch of microscopy. To the meteorologist and the engineer, it is now an important means of converting the international standard of length into a practical *scale*. The field of interferometry has advanced in such a way that in each of these fields, the user is *familiar* with the techniques and applications relevant to the field.

1.2 Interferometry in Radio Astronomy

Interference occurs when radiation follows more than one path from its source to the point of detection. It may be described as the departure of the resultant

intensity from the laws of addition. This is because **as** the point of detection is moved, the intensity oscillates about the sum of the separate intensities from each path, leading to maxima and minima in the intensity pattern. These are generally called interference **fringes**. The technique of interferometry is derived from these interference patterns. And today, it has evolved into one of the most important methods of experimental physics, with applications extending to many branches of science and technology, **as** indicated earlier.

The first use of interferometry in radio astronomy was reported in 1947 [2]. Since then, there have been many radio interferometers developed and used in *astronomical* studies. The first radio interferometer made use of the reflections from the surface of the sea to provide the second path; but later instruments were developed **making** use of two separate antennas in the system. The powerful technique of aperture synthesis was a spin-off from radio interferometers [3]. This technique has formed the basis for several new radio telescopes that were built in later years, with resolutions, until then thought of as unrealisable [4,5,6]. Some of these interferometers are now operating over a wide range of Radio Frequencies (*RF*) for a variety of astronomical applications all over the world. *In* the last over four decades, there has been considerable development and improvement in the techniques employed, and the electronics involved in realising these *interferometers*. Major advances in interferometry in recent years have largely been **influenced** by:

- a) Progress in electronics
- b) Advances **in** computers; and
- c) Wider range of applications.

While the advances in electronics during this period have greatly *influenced* the development of better and better instrumentation for the radio interferometer, progress in digital computers has contributed a great deal in the field of analysis of observed data. This is particularly important as the study of the distribution of radiation over the sky involves manipulation of a large database. However, more recently, as the cost of computers has begun to decrease and their functionality to greatly increase, they have also been used for data acquisition in radio *interferometry*. As a result, there is now a wide variety of main-frame and mini-computers in use all over the world in radio astronomy applications. However, there are some limitations suffered by these radio *interferometer* systems:

- a) Lack of standardisation in data structures
- b)* Incompatibility of secondary storage media
- c) Multiplicity of programs for the same type of analysis
in different systems
- d) Need for two separate computers viz.,
 - (i) data acquisition
 - (ii) data *analysis*

This has resulted in the data acquired at one location not being easily *analysed* at another location leading to problems in free exchange of unprocessed data from one observatory to another. This has *also* resulted in lack of *flexibility* that is so much needed in this important field. Also there is a need for preliminary on-line data analysis, to monitor it for interference, which is especially predominant at low *frequencies*. This *would* avoid the collection of

unnecessary data, thereby saving data storage space. Considering these ~~limi~~tations, and keeping in view the recent developments in Personal Computers (*PCs*) and their possible uses in instrumentation, it was decided to conduct a detailed investigation on the use of *PCs* to radio interferometer applications. As the *Raman Research Institute* already had a plan of developing a new radio interferometer at 150 *MHz*, it was decided to try out the new ideas resulting from this investigation in the system design and implementation of this new interferometer. This interferometer, which can be aptly termed as an intelligent instrument, would, not only solve the problem of data transportability but also incorporate a real-time Data Acquisition System (*DAS*) in it. This would enable on-line data acquisition, interference monitoring and storage, as well as off-line data analysis *all* in the same system. The result of this investigation is the development of a **PC-based radio interferometer**, which is described in detail in this thesis.

1.3 Thesis Organisation

The thesis is organised in five Chapters. Following this introductory Chapter, Chapter *II* reviews existing radiotelescopes historically, leading to different approaches in radio astronomy for the improvement of resolution. The radio interferometer forms the basic building block in these radio telescopes. A typical interferometer is then described in detail, drawing attention to the various limitations in present-day systems. This is followed by a brief discussion on the approach leading to the need of PC-based instrumentation in these applications.

Chapter *III* presents the detailed specifications of the *overall* PC-based *inter-*

ferometer system designed and developed at the *Raman Research Institute*. As the PC-based *DAS* is *an* innovation in radio interferometry, much of the discussion here is directed to the PC-based DAS for use in the radio interferometer. However, system design aspects of the total radio interferometer are also *briefly* touched upon here.

Chapter *IV* describes the experimental work done to *realise* the overall radio interferometer system *including* the system integration. The details of the various experimental setups for evaluating the performance of the different building blocks along with their corresponding results are also given here. This is followed by the testing and evaluation of the overall PC-based radio interferometer system. The results of simulation tests and the final radio source observations are then presented to clearly demonstrate the performance of the *overall* system.

Chapter V is the concluding Chapter which reviews the entire work and also indicates the scope for future studies and investigation in this area.

References to published literature are then listed followed by four Appendices covering supplementary *information*.
